

Axial thermomechanical model setup — schematic

The domain follows the project setup direction: 50 km × 50 km by 10 km depth. The 6 km reservoir axis strikes N30°W. \*The side and basal 30 °C/km geotherm is an explicit thermal assumption. The four-case calibration retains a fixed base; a separate Winkler diagnostic uses the regional 32,373 Pa/m coefficient. Its 288.414 MPa lithostatic reference needs gravity equilibrium before absolute-stress comparisons; the tectonic face-rate split remains unresolved.
